

## Asbestos & Demolition

Dawsons Asbestos and Demolition have a team of highly trained staff that are experienced in all forms of asbestos removal works. We understand the requirements of all facets of the removal process, and can use our experience to limit the potential risks to our clients. Dawsons Group is licensed by the Queensland Division of Workplace Health and Safety to undertake both 'Bonded' and 'Friable' asbestos removal works, as well as being licensed with the EPA as transporters of asbestos waste, and demolition. We can provide all documentation from job site through to the disposal site.

Safety is of the utmost importance and prior to any work commencing the Dawsons Asbestos team conduct thorough risk assessments in consultation with our employees and clients.

A safe work procedure is then devised to minimise the release of dust and fibres and avoid exposure.

### Dawsons Asbestos & Demolition - Points of difference:

**In order to meet the requirements of our vast client base, we remain focused on our objectives, whilst retaining the flexibility required to offer our customers an 'individual' touch.**

**Dawsons have a fully equipped mobile crew at the ready -- turnaround time is very short.**

**We keep our team small, highly trained and limit the number of work fronts, as we believe the quality of the operation is paramount, not the volume of work we do.**

**Similarly, our demolition team is small, trained and motivated. We don't pride ourselves on being the biggest in the business, but do recognise that we can offer effective solutions to our clients, in a safe, controlled environment, and in accordance with all local, state and commonwealth requirements.**

**Asbestos removal is a 'high-risk' procedure, requiring trained staff; specific specialised equipment and precision Project Management. The Dawsons Asbestos removal team understands this process; has the equipment and the know-how to undertake works in any location – no matter how remote.**

**'Task Specific' risk assessments are conducted in consultation with both Clients and staff members.**

**Safe Work Procedures are developed to minimise the potential for risk associated with the release of airborne fibres.**

**Control measures are established, evaluated and implemented to ensure the risk factor is mitigated from start to finish.**

**We pride ourselves on our proven track record with zero incident reports. Safety is our first priority for our clients and our team.**
